Problem Statement

- Many schools still conduct student council elections using traditional paper ballots and manual vote counting. This process is time-consuming, often taking hours or even days to complete, especially in schools with a large number of students. Manual counting is also cause to human error, such as miscounted votes, illegible handwriting, which can lead to inaccurate results.
- In addition, the traditional system lacks transparency, since students have no way to verify how votes were counted, which can lead to doubts about the fairness of the election. There is also no reliable way to prevent students from voting more than once, since paper-based systems depend heavily on manual monitoring.
- These issues can result in delayed the results,disputes over results, and reduced trust the process.

Project Abstract

- The Student Council Election Tally System is a computer program that helps schools run student council elections more easily and accurately. Instead of counting votes by hand, this system lets students vote online and automatically counts the results.
- The system has two main users: students, who log in and vote for their preferred candidates, and administrators, who add candidates, manage the election, and view the final results. To keep the election fair, the system makes sure each student can only vote once.
- Once voting ends, the system automatically calculates and displays the results — no manual counting needed. This saves time, reduces mistakes, and makes the whole process more transparent and trustworthy.
- Overall, this project shows how technology can make school elections faster, fairer, and easier to manage.

Topics Used From CO 1

1. Java Program Structure :

```
public class ElectionTally {
public static void main(String[] args) { ... }
```

2. Scanner Class :

```
Scanner scanner = new Scanner(System.in);
int choice = scanner.nextInt();
```

3. Operators & Expressions :

```
votes[choice - 1]++;
if (choice >= 1 && choice <= 3)
```

- Arithematic,Relational,and Increment Operators are used.

Topics Used From C0 2

1. Loops :

- While loop and if - else if loop is used.

```
if (choice == 0) {
break;
} else if (choice >= 1 && choice <= 3) {
votes[choice - 1]++;
System.out.println("Vote recorded!");
} else {
System.out.println("Invalid choice!");
```

2. Loop Control Statements :

```
if (choice == 0) {
break;
```

Topics Used From CO 3

1. Arrays(One - Dimentional Arrays) :

```
String[] candidates = {"Alice", "Bob", "Charlie"};
int[] votes = new int[3];
```

2. Iteration :

```
for (int i = 0; i < candidates.length; i++) {
System.out.println(candidates[i] + ": " + votes[i] + " votes");
if (votes[i] > maxVotes) {
maxVotes = votes[i];
winnerIndex = i;
}
```
